A. The value of R_{iJA} is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{ C}$. The Power dissipation P_{DSM} is based on R_{iJA} t $\leqslant 10\text{s}$ value and the maximum allowed junction temperature of 150° C . The value in any given application depends on the user's specific board design, and the maximum temperature of 150° C may be used if the PCB allows it.

B. The power dissipation P_D is based on $T_{J(\text{MAX})}=150^\circ\text{ C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

C. Repetitive rating, pulse width limited by junction temperature $T_{J(\text{MAX})}=150^\circ\text{ C}$. Ratings are based on low frequency and duty cycles to keep initial $T_J=25^\circ\text{ C}$.

D. The R_{iJA} is the sum of the thermal impedance from junction to case R_{iJC} and case to ambient.

E. The static characteristics in Figures 1 to 6 are obtained using <300μs pulses, duty cycle 0.5% max.

F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of $T_{J(\text{MAX})}=150^\circ\text{ C}$. The SOA curve provides a single pulse rating.

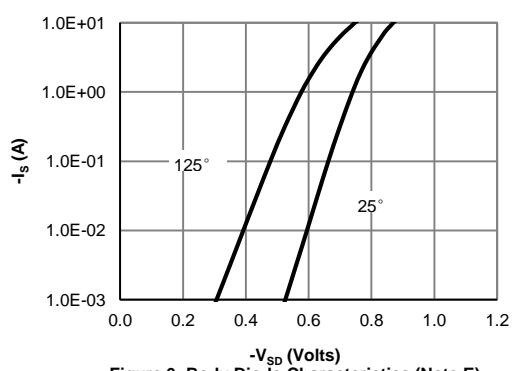

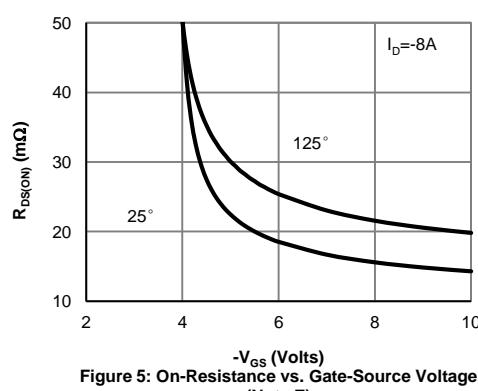

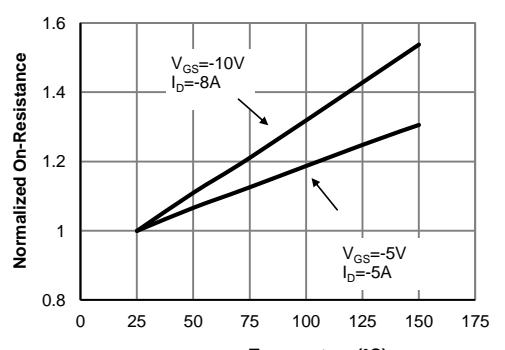

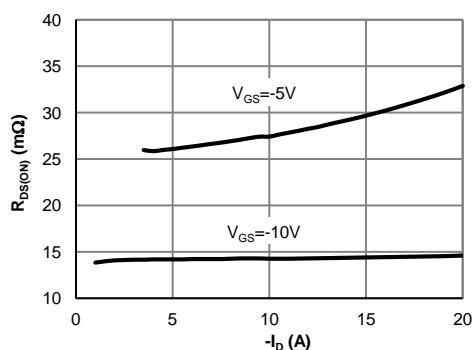

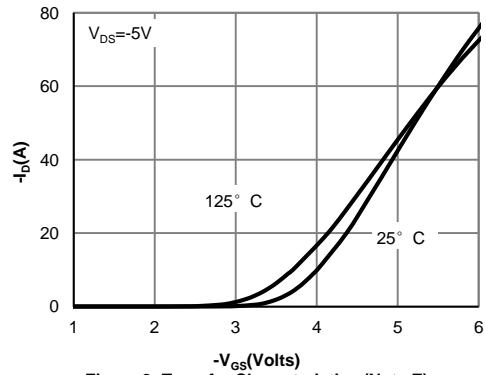

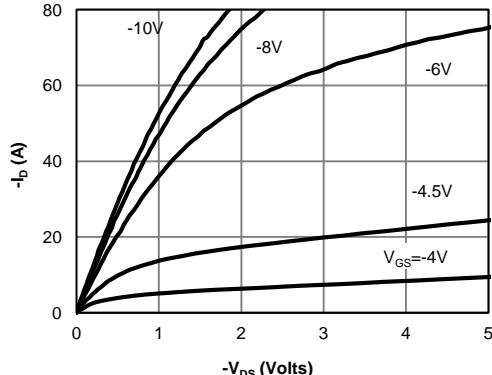

G. The maximum current rating is package limited.

H. These tests are performed with the device mounted on 1 in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{ C}$.
