\*7 Propagation delay skew is defined as the difference between the largest and smallest propagation delay times (i.e.  $t_{PHL}$  or  $t_{PLH}$ ) of multiple samples. Evaluations of these samples are conducted under identical test conditions (supply voltage, input current, temperature, etc).

\*8 Common mode transient immunity at output high is the maximum tolerable negative dv/dt on the trailing edge of the common mode impulse signal,  $V_{CM}$ , to assure that the output will remain high (i.e.  $V_O > 15.0V$ )

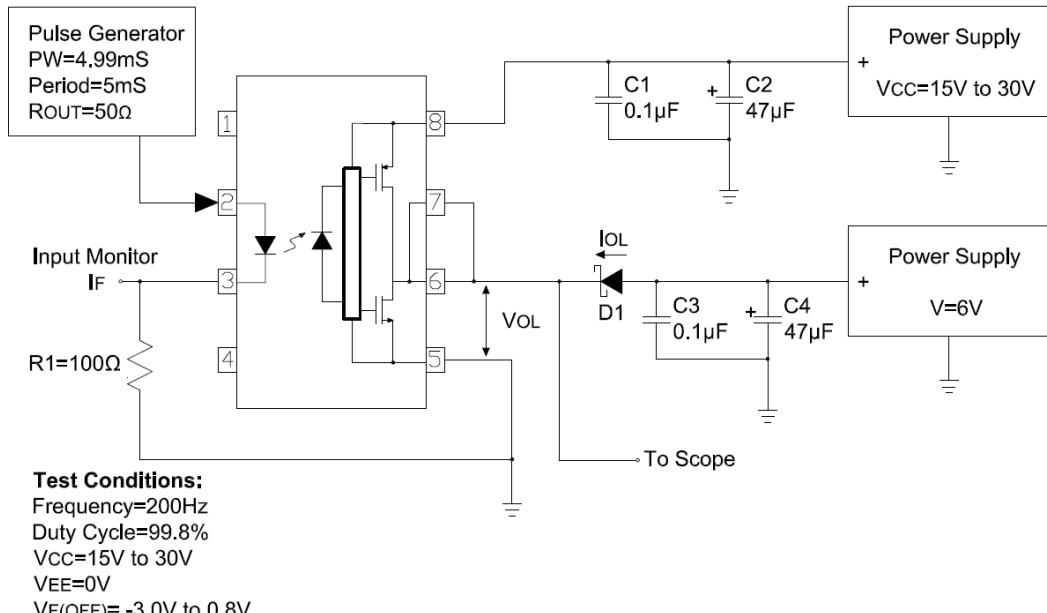

\*9 Common mode transient immunity at output low is the maximum tolerable positive dv/dt on the leading edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain low (i.e.  $V_O < 1.0V$ )
